

Philosophical transactions of the Royal Society of London Volume 190 Containing papers of a mathematical or physical character

Filesize: 3.13 MB

Reviews

Undoubtedly, this is the greatest job by any author. It is actually filled with wisdom and knowledge I am quickly could get a pleasure of reading a written book.
(Kade Ankunding)

RareBooksClub. Paperback. Book Condition: New. This item is printed on demand. Paperback. 172 pages. Dimensions: 9.7in. x 7.4in. x 0.4in. This historic book may have numerous typos and missing text. Purchasers can download a free scanned copy of the original book (without typos) from the publisher. Not indexed. Not illustrated. 1898 Excerpt: . . . poles of neighbouring elements, instead of taking the single polarized element as the unit; it shows that these adjacent poles nearly compensate each other except as regards a simple volume density whose attraction has no molecular part, and a surface density partly at the outer surface and partly at the surface of the cavity which contains the point under consideration. The effect of the latter surface density, depending as it does wholly on the immediate surroundings, is the molecular or cohesive part of the average force. These principles may be enforced and illustrated by contrast with a procedure by separate molecules which would usually lead to a different result; it will suffice to consider the case in which the polarization is uniform in direction throughout the material. If the axis of x be taken in the direction in which the intensity of the electric polarization changes most rapidly in the neighbourhood of the point considered, it is easy to see that the bodily force on an element due to the surrounding polar molecules is parallel to x and equal to $-\frac{1}{2} \frac{d^2 \phi}{dx^2}$ (and $\frac{1}{2} \frac{d^2 \phi}{dy^2}$), and thus derivable from a potential function $-\frac{1}{2} (a^2 y^2 + b^2 z^2)$, where a, b are constants. In the case of an interface of rapid transition from one uniformly polarized medium to another, there is thus a force only in the transition layer, and its integral throughout that layer is equivalent to a traction parallel to the axis of x , of intensity $-\frac{1}{2} \frac{d^2 \phi}{dx^2} \sin 2\theta$...
